

Info

The layout for the program has already been done, and you do NOT have to do anything to it. A working executable has been included, so you can verify the desired behaviour

Class Workout

Properties:

- String Exercise
- String Description
- Double Calories

ToDo: complete the following four event handlers

cmbExercise_SelectionChanged

When the user makes an exercise selection, you must

- Update the window so that the information about the description is shown (calories, exercise, and description)

btnAcceptCurrentSelection_Click

When the user clicks “Accept” button

- If a valid exercise is selected then
 - Add the calories of the currently selected exercise to the total
 - Display the new total
 - Clear selected exercise (and exercise/description/calories)

btnCancelCurrentSelection_Click

When the user clicks “Cancel” button (for selected exercise)

- If a valid exercise is selected then
 - Clear selected exercise (and description/item/price)

btnSubmit_Click

When the user clicks “Submit” button

- Display Message Box, indicating what how many calories you have burned, in total.
